SUMMARY

Full-stack developer with nearly four years of professional experience building web applications and APIs, mostly in healthcare software. I work mainly on the backend and the database of a multi-tenant SaaS platform for clinical laboratories, and I also contribute to the Angular frontend. My core stack is Python (FastAPI, SQLAlchemy, Alembic) and SQL, and I have built integrations with external health systems using HL7 v2.6 over MLLP and FHIR.

I'm comfortable where legacy and modern systems have to coexist: turning ambiguous third-party requirements into clear contracts, validations and tests. Outside work I built and run my own LLM-powered web app in production. I lived and worked in Japan on a Working Holiday (2024–2025).

EXPERIENCE

Full-Stack Developer · Wiener Lab — Jun 2025 – Present · Rosario, Argentina (hybrid)

Multi-tenant SaaS platform for clinical laboratory management. Main focus on backend and database; I also contribute to the frontend.

- **Backend:** develop and maintain services in Python, FastAPI, SQLAlchemy and Alembic, including REST endpoints, data models and schema migrations.
- **Database:** design and maintain SQL Server schemas, complex queries, views, triggers and migrations, including per-tenant data separation.
- **Healthcare integrations:** inbound HL7 v2.6 messages (ADT, OML) over MLLP, FHIR-based exchange of orders, observations and reports (including PDF results), and MQTT notifications. This includes validating and mapping facilities, practitioners, diagnoses and test codes.
- **Legacy compatibility:** keep legacy Java components (HAPI HL7, Tomcat) working alongside newer Python services, with a focus on message state and testing.
- **Identity and SaaS:** Keycloak authentication and authorization (OIDC/SSO, RBAC, realms, tenant isolation), tenant administration, feature flags, quotas and subscription plans.
- **Frontend:** Angular features (recently Angular 20) with TypeScript, RxJS, TailwindCSS and Angular Material. Services run with Docker Compose and are tested with pytest, including end-to-end tests.

Night Auditor · NISADE × The Luxe Nomad — Nov 2024 – Mar 2025 · Niseko, Japan

- Working Holiday: night operations, guest services, and audit and control tasks for international guests, working in English every day.

Full-Stack Web/API Developer · NEORIS — Sep 2022 – Apr 2024 · Rosario, Argentina

- Web and mobile project features with ASP.NET MVC (C#) on the backend and JavaScript/jQuery on the frontend.
- SQL schema design and query optimization; agile teamwork with Git and Jira.

Full-Stack Developer · Fantommers — Oct 2021 – Oct 2022 · Rosario, Argentina

- Healthcare-sector web applications with Node.js backends, Angular frontends and SQL Server, including API integrations.

SELECTED PROJECTS

Arky · LLM-powered assistant for cooking and personal finance — Live in production · built solo

The assistant takes real actions against the database, not just answers: it creates recipes, adds missing items to the shopping list and records expenses, and it asks for confirmation before any money-related change. The AI provider sits behind an interface, with Gemini in production and a deterministic mock for development and tests. More than 850 backend tests, 88 frontend unit tests and an end-to-end Playwright run. The source code is private and available on request.

Angular 20 · FastAPI · SQLAlchemy · PostgreSQL · JWT · Gemini API · Docker · Railway · arky-landing-production.up.railway.app · open finance module: github.com/Lauaf/Arky-Finances

Sandō · browser game for learning Japanese, piano and coffee — Personal project

A pixel-art town with kana battles, N5–N3 vocabulary with spaced repetition and conversation with a local LLM. It also has a cinema that breaks Japanese YouTube subtitles into words with readings and meanings, a MIDI music room and coffee simulations. Vanilla JavaScript, no build step.

Dog breed recognition · university project, team of two — UNR · Computer Vision

Similarity search with pgvector, a fine-tuned ResNet18 (91.6% test accuracy, F1 0.91) against a custom CNN, and YOLOv8 detection, served by an async FastAPI with Docker Compose. github.com/Lauaf/TP2_VC

EDUCATION

Associate Degree in Artificial Intelligence · Universidad Nacional de Rosario — In progress

Tecnicatura Universitaria en Inteligencia Artificial. Coursework includes Programming III, Databases I, Image Processing and Computer Vision.

SKILLS

Backend	Python, FastAPI, Pydantic, SQLAlchemy, Alembic, REST API design, pytest · earlier: Node.js, C#, ASP.NET MVC
Frontend	Angular, TypeScript, RxJS, TailwindCSS, Angular Material, JavaScript
Databases	SQL Server, PostgreSQL, MySQL, SQLite · some Redis
Identity and SaaS	Keycloak, OpenID Connect (Authorization Code + PKCE), SSO, RBAC, JWT, multi-tenancy, feature flags
Health interoperability	HL7 v2.6 (ADT, OML, MLLP), FHIR (ServiceRequest, DiagnosticReport, Observation), MQTT
AI integration	LLM APIs (Gemini) with action execution and provider abstraction
Tooling	Docker, Docker Compose, Git, GitLab, GitHub Actions, Railway, Jira, Linux/WSL2
Languages	Spanish (native) · English (advanced) · Japanese (basic–intermediate, no JLPT certificate)
